## AMENDMENTS TO THE SPECIFICATION

*Please replace the paragraph bridging page 14 and page 15 with the following paragraph:*

"Percent (%) amino acid sequence identity" is defined as the percentage of amino acid residues in one sequence that are identical to, with, or against amino acid residues in a second sequence in the region of overlap when the two sequences are optimally aligned. To determine percent amino acid identity, sequences are locally aligned and if necessary, gaps are introduced to achieve the maximum percent sequence identity; conservative substitutions are not counted when calculating sequence identity. Amino acid sequence alignment procedures to determine percent identity are well known to those of skill in the art. Publicly available computer software such as BLAST software (NCBI website at [www.ncbi.nlm.nih.gov/BLAST/](http://www.ncbi.nlm.nih.gov/BLAST/)) may be used to align peptide sequences. Those skilled in the art can determine appropriate algorithms and parameters for measuring alignment, including any algorithms and parameters needed to achieve optimal alignment of two amino acid sequences.
